# FULL DAQ REBOOT CHEAT SHEET

current as of March 25, 2016
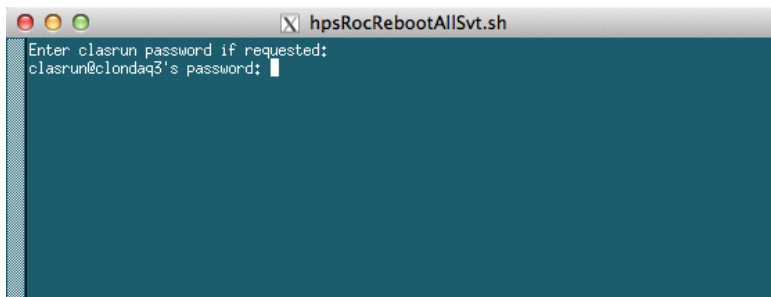

1. From the main HPS_EPICS screen, click `DAQ Status` to open the status/reboot window.

2. From the DAQ status/reboot window, click `Reboot FULL DAQ` and confirm the popup that appears.

3. A terminal window will open, which may ask for the password for `clasrun`. If so, enter it and press return.

4. After the TDAQ is rebooted, press enter to proceed to rebooting the SVT DAQ, which may again require a password.

5. If the SVT DAQ reboot hangs at any point for more than a few seconds, abort with `ctrl-C` as instructed and then click the `Reboot SVT DAQ` button.

6. After the DAQ is rebooted, check that the **FEB Status**, **IOC Status**, and **Hybrid Status** lights are all green in the SVT Summary GUI and restart the Run Control GUI: as **clasrun** on **clondaq3**, run the command...
   ```
   > runcontrol -rocs
   ```
   (a window on clondaq3 is probably already open with this command in history.)

This procedure should take less than ten minutes. If this procedure fails, **call the DAQ expert!!!!**
